Objectives: The goal of this course is to teach basic and advanced solution techniques, including exact and approximate approaches, for a wide range of conduction heat transfer problems. Included are both multidimensional steady state and transient analyses, with emphasis on the fundamental physics and underlying mathematics associated with heat transfer. Accordingly, this course will stress the concepts of energy balance and boundary conditions with a wide range of formal solution techniques for solution of governing heat transfer equations. Upon completion of this course, students are expected to understand advanced heat transfer solution techniques coupled with a strong foundation and appreciation for the physics and mathematics of conduction heat transfer. Micro-scale heat transfer, including energy carriers, carrier length scales, and micro-scale heat transfer regimes is also covered at the introductory level.
