## PROPERTIES OF THE TAU AND SIGMA FUNCTION OF NUMBER THEORY

## INTRODUCTION:

It is well known that any positive integer can be written as the product of primes taken to a specified integer power. Thus

$$
\left.N=\left(p_{1} \wedge a\right)\right)^{*}\left(p_{2} \wedge b\right)^{*}\left(p_{3} \wedge c\right) \ldots
$$

, where $p_{n}$ are the ascending primes $p_{1}=2, p_{2}=3, p_{3}=5$ and $a, b, c, .$. its integer powers. For the number $\mathrm{N}=16$ we have as divisors-
[1,2,4,8,16]
with the total number of divisors being called the tau function equal here to $\tau(16)=5$. The sum of the divisors is known as the sigma function and equals $\sigma(16)=31$. It is our purpose here to discuss the properties of the tau function and its link to the sigma function.

## DETERMINING TAU(N):

In the above case of $N=16=2^{\wedge} 4$ we see the $2^{n}$ appears four times. This is one less than $\tau(16)=5$. So to get $\operatorname{tau}(N)$ for a more general $N$ we have-

$$
\tau(N)=(a+1)(b+1)(c+1) \ldots
$$

For $\mathrm{N}=78=2^{\wedge} 1^{*} 3^{\wedge} 1^{*} 13^{\wedge} 1^{*}$ we get-

$$
\tau(78)=(1+1)(1+1)(1+1)=8
$$

As another integer take $N=72000=\left(2^{\wedge} 5\right)\left(3^{\wedge} 2\right)\left(5^{\wedge} 3\right)$. So $\operatorname{tau}(N)=(5+1)(2+1)(3+1)=72$. Thus $\tau(N)$ for any positive integer N just represents the product of the exponent in the ifactor of N representation with one added. So, for instance,-
$N=80,000$ has ifactor $(N)=2^{\wedge} 7^{*} 5^{\wedge} 4$ so that $\tau(N)=(7+1)(4+1)=40$
When $N$ equals a single prime $p$, tau will always be tau $(p)=2$. When $N$ equals $p^{2}$, the value of tau becomes tau $\left(p^{2}\right)=3$. For $N=p^{\wedge} n$ we have tau $\left(p^{\wedge} n\right)=(n+1)$.

## FINDING SIGMA((N):

To find the connection between the sigma function and the tau function we first write out the following table-

| $N$ | $\tau$ | $\sigma$ |
| :--- | :--- | :--- |
| $2^{\wedge} 1$ | 2 | 3 |
| $2^{\wedge} 2$ | 3 | 7 |
| $2^{\wedge} 3$ | 4 | 15 |
| $2^{\wedge} 4$ | 5 | 31 |
| $2^{\wedge} 5$ | 6 | 63 |
| $2^{\wedge} 6$ | 7 | 127 |
| $2^{\wedge} 7$ | 8 | 255 |

On studying this table we see at once that-

$$
\sigma=2^{\mathrm{T}}-1 \text { for } \mathrm{N}=2^{\mathrm{n}}
$$

Next look at the second table-

| $N$ | $\tau$ | $\sigma$ |
| :--- | :--- | :--- |
| $3^{\wedge} 1$ | 2 | 4 |
| $3^{\wedge} 2$ | 3 | 13 |
| $3^{\wedge} 3$ | 4 | 40 |
| $3^{\wedge} 4$ | 5 | 121 |
| $3^{\wedge} 5$ | 6 | 364 |
| $3^{\wedge} 6$ | 7 | 1093 |
| $3^{\wedge} 7$ | 8 | 3280 |

From it we conclude that -

$$
2 \sigma=3^{\tau}-1 \text { for } N=3^{n}
$$

Finally a third table involving $N=5^{\wedge} n$ reads-

| $N=3^{\wedge} n$ | $\tau$ | $\sigma$ |
| :--- | :--- | :--- |
| $5^{\wedge} 1$ | 2 | 6 |
| $5^{\wedge} 2$ | 3 | 31 |
| $5^{\wedge} 3$ | 4 | 156 |
| $5^{\wedge} 4$ | 5 | 781 |
| $5^{\wedge} 5$ | 6 | 3906 |
| $5^{\wedge} 6$ | 7 | 19531 |
| $5^{\wedge} 7$ | 8 | 97656 |

From it we find-

$$
4 \sigma=5^{\wedge} \tau-1 \text { for } N=5^{\wedge} n
$$

We can generalize the last three results as-
$\sigma=\left(p^{\wedge} \tau-1\right) /(p-1)$ with $N=p^{\wedge} n$
So if $N=7 \wedge 3=343$ we have $\tau=4$ and $\sigma=400$.
We are now in a position to find both $\tau$ and $\sigma$ for any positive integer N by first taking the ifactor of N and then working out it exponent sum to get $\tau$ and then finding the product of each exponential terms sigma to get the entire $\sigma$ product. Let us demonstrate things for the number -
$N=46821$ whose ifactor reads $\left(3^{\wedge} 2\right)\left(11^{\wedge} 2\right)\left(43^{\wedge} 1\right)$
This yields -

$$
\tau(N)=(2+1)(2+1)(1+1)=18 \quad \text { and } \quad \sigma(N)=13 * 133 * 44=76076
$$

Thus if we know the value of tau( N$)$, which is easy to calculate, there is no problem finding sigma(N).

## CONCLUDING REMARKS:

We have shown how both the tau and the beta functions are generated starting with the ifactor representation of any positive integer $N$. After carrying out the easy calculation for tau( $N$ ), we generate $\sigma(N)$ by working out the sub values of $\sigma(N)$ and then taking the product to get $\sigma(N)$. In general we have $\tau \ll \sigma$ and $\sigma \approx$ $p^{\tau-1}$ as $p$ gets large.
